

KMS Upgrade

KOMORIKare

The Komori Management System (KMS) software is already installed on Komori presses. It allows you to work more productive and precise. KMS IV is the management software that is installed on older Komori machines. You now have the chance to update to the latest version, which is KMS V.

Operators change regularly between jobs and machines while being in the press room, which makes it difficult to adapt quickly to different versions of software. That is where KMS V comes along. This software update allows printers to move easily between printing presses and experience no problems between various software programmes. The interface is the same as KHS AI V5.

Benefits

- Greater production.
- Less downtime.
- Less operational issues.
- Better productivity.

The KomoriKare KMS Upgrade works best when combined with Windows 7.0 64 bits on a desktop computer.

Specifications

Product name KomoriKare KMS Upgrade

Product construction Software update

Package USB Flashdrive
